

1. In a for loop, the initialization statement happens once before the loop starts.
2. In the while loop, move this initialization statement outside the loop, as it's executed only once, before the loop starts.

For Loop:

```
for (int i = 0; i < 10; i++) {
```

```
//initialization, conditions, and updates come when the loop is made
```

```
}
```

While Loop:

```
int i = 0; // Initialization happens before the loop
```

```
while (i < 10) { /condition is checked when the loop is made
```

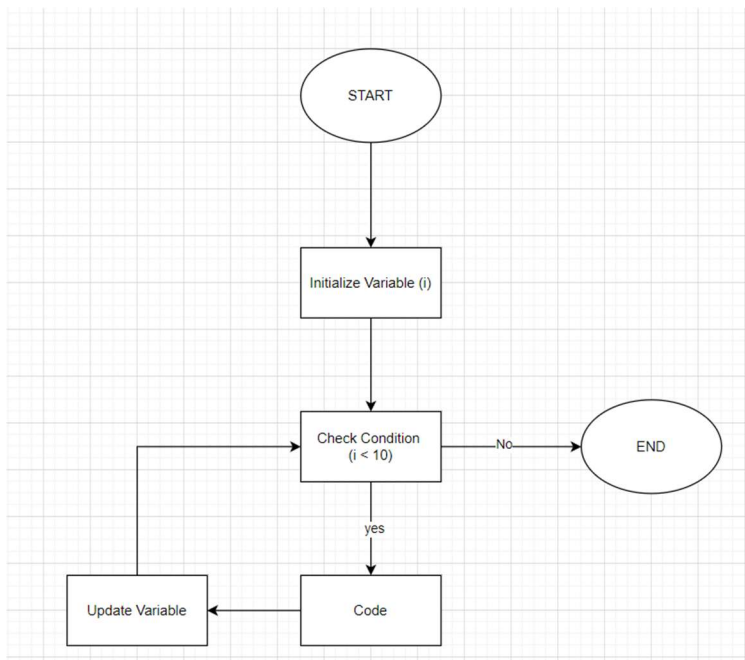

```
// body
```

```
i++; // Update happens inside the loop
```

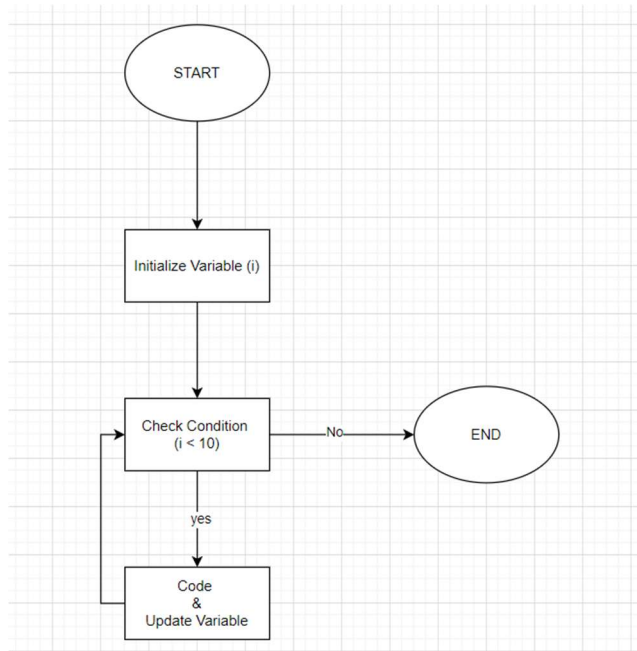

```
}
```

For Bonus Points:

For Loop:

While Loop:

Differences:

1. In a for loop, the variable is updated at the start after the loop has been executed.
2. In a while loop, the variable can be updated anywhere inside the loop code structure.
3. Variable updating is freer in while loops.
