

Critical thinking task

A coffee machine functions like a program, where menu options—such as espresso, americano, and cappuccino—serve as function declarations. The various customization choices, like no sugar, milk, creamer, or sweetener, act as parameters. When we select a specific type of coffee along with our preferred customizations, we are essentially calling the function and passing arguments (e.g., cappuccino with no sugar). In return, we receive a freshly brewed cup of coffee, which represents the function's return value.
