

Pseudocode Lab 3

1. Prompt the user to input both the year and the quarter.
2. Set the epoch year to 1977, define the number of quarters in a year as 4, and assign the epoch quarter as 1.
3. Compute the total number of quarters for the user's input using the formula:
4. Calculate the total number of quarters for the epoch using: Determine the number of quarters between the epoch and the user's input by subtracting the epoch's total quarters from the user's total quarters.
5. Display the final output by calling appropriate functions to print the exact statement and compute the GDP per working-age person.
